

BAE Systems Expands Geospatial-Intelligence Agency Mission Support

The National Geospatial-Intelligence Agency (NGA) has awarded BAE Systems a five-year, US\$250 million contract to continue providing Full-Motion Video (FMV) advanced analytic services, training, and intelligence production support.

“Our experts play a role in analysing multiple FMV feeds to produce actionable intelligence in support of a 24/7 national security mission,” said Peder Jungck, vice president and general manager of BAE Systems’ Intelligence Solutions business.

In addition to providing analytic mission support, BAE Systems will introduce a new Performance Innovation Council to introduce NGA leaders to new FMV services, software, systems, platforms, and sensors developed by BAE Systems and its programme team,

made up of several intelligence and technology companies. The creation of this council directly aligns with [NGA's Team GEOINT initiative](#), which encourages industry, academia, professional organisations, and foreign allies to work together and support common technical standards that will enhance intelligence sharing and collaboration.

“Our team includes the world’s largest intelligence, surveillance, and reconnaissance businesses,” said Jungck. “Together, we will exchange analytic best practices with our NGA leaders and provide the agency with insights into our respective technology roadmaps to ensure our future software, platforms, and sensors are designed from the start to meet their mission needs.”

The task-order contract was awarded under NGA’s Multi-Intelligence Analytical and Collection Support Services indefinite delivery, indefinite quantity contract.
